Partner Commission & Payout Architecture

Complete answers to the 7 implementation questions + voucher assignment, settlement, payout and chargeback rules

Prepared for Generoso | USA Local SIM / LinkingSIM

Executive Flow

Customer Payment -> **Stripe** -> **Normal Settlement** -> **Automatic Stripe Payout** -> **Wise Business** -> **Commission Engine** -> **Wise API** -> **Partner Brazilian Bank Account**

Alternative customer payment rail when used: Asaas -> funds settled/available -> Commission Engine -> payout process.

Core principle: partner commissions are funded from the actual proceeds of voucher sales. LinkingSIM does not advance commissions with its own money. A commission may be recorded for tracking, but it can only enter payout after the corresponding sale funds are settled and available.

Key Decisions at a Glance

Rule	Decision
Default commission	R$60 per voucher, but fully configurable by Admin; never hard-coded.
Commission currency	BRL.
Commission event	Only the original voucher sale. Redemption, activation, plan selection and later upgrades do not create a second commission.
Voucher ownership	Vouchers are produced first as UNASSIGNED, then assigned by Admin to a Partner using batch/serial ranges.
Payout timing	Only after the actual sale funds are settled/available.
Payout cadence	Automatic daily consolidated payout per Partner, containing only eligible available commissions.
Stripe -> Wise	Keep the existing automatic standard payout schedule. No Instant Payout and no special per-voucher Stripe transfer logic.
Chargebacks	If already paid, do not ask Partner to return money. Create a negative commission adjustment and offset it against future commissions with voucher-to-voucher traceability.

1. Commission Formula

The current standard commission is R$60 per voucher sold. However, R$60 must NOT be hard-coded. The Admin must be able to configure the commission amount without code changes.

- Default today: R$60 per voucher.
- Commission is a fixed BRL amount, not a percentage of the sale and not reduced by Stripe/payment fees.
- Admin may set different commission amounts by Partner and, when needed, by assigned batch/serial range or commercial campaign.
- The commission applicable to a completed sale must be snapshotted and permanently stored on that commission record.
- Changing a Partner from R$60 to R$70 tomorrow must not change historical sales that were sold at R$60.

Example

Partner A = R$60; Partner B = R$50; Partner C = R$70. Voucher #000150 is sold while Partner A's commission is R$60. Even if Partner A changes to R$70 later, Voucher #000150 remains R$60 forever.

2. When Does Commission Become Payable?

The commission is paid from the actual money received from that voucher sale. LinkingSIM will not advance the Partner commission using unrelated or company funds.

- Customer payment must first be successfully processed.
- The payment must then be settled and the funds actually available for the payout flow.
- Stripe/Wise: wait for the normal Stripe settlement and automatic payout to Wise; no extra T+7/T+14 hold after funds are available.
- Asaas: wait until Asaas confirms the corresponding sale funds are settled/available.
- Commission release does not depend on SIM activation, redemption, travel date or service start date.

Rule: receive the sale money first -> then release the applicable Partner commission.

Stripe -> Wise: Existing Automatic Flow Must Remain Unchanged

- The existing Stripe -> Wise payout is already automatic.
- Do not implement Instant Payout for this process.
- Do not create one Stripe transfer per voucher.
- Do not wait for a specific number of voucher sales before allowing Stripe's normal payout.
- The commission system should not try to optimize or control Stripe -> Wise. It starts acting only when the corresponding funds are available for the commission/payout process.

3. Which Sales Earn Commission?

A Partner commission is generated only once: on the original sale of the voucher.

- Eligible original voucher sales may be paid through Stripe (card / Apple Pay / Google Pay), Pix/Asaas when used, or dealer/partner point-of-sale flows supported by the system.
- Voucher redemption = no new commission.
- SIM/eSIM activation = no new commission.
- Plan selection during redemption = no new commission.
- Later upgrade/add-on = no new initial Partner commission.
- Each voucher can generate the original Partner commission only once.

The commission record must be linked to the original Voucher ID/Serial and original Sale/Transaction ID to prevent duplicate commission generation.

4. Partner / Dealer Account and Voucher Assignment

Vouchers are NOT produced for a specific Partner. They are produced first, entered into general inventory as UNASSIGNED, and only later allocated to Partners after commercial agreements are closed.

Required inventory flow

Production -> **General Inventory (UNASSIGNED)** -> **Admin Assignment to Partner** -> **Sale** -> **Settlement** -> **Commission**

Example

10,000 vouchers are produced. Initially, Serial 000001–010000 = UNASSIGNED. Later, 50 vouchers are given to Partner João: Serial 000001–000050 -> Partner João. This assignment identifies who is entitled to commission if a voucher is sold, but assignment itself creates no commission.

- Admin must be able to assign vouchers in bulk by batch and/or serial-number range.
- Unassigned vouchers have no commission beneficiary.
- Producing a voucher creates no commission.
- Assigning a voucher creates no commission.
- Selling an assigned voucher creates the applicable commission, subject to settlement/availability.
- Unsold vouchers may be returned to UNASSIGNED or reassigned to another Partner, while preserving full assignment history.
- A sold/redeemed voucher must not be reassigned in a way that changes its historical Partner/commission record.
- For larger Partners, support optional Store/Location/Sub-account tracking under the main Partner.
- The payout beneficiary is the Partner/Distributor. Dealer/User or Store/Location can be retained for operational reporting.

Key rule: commission entitlement comes from the Partner assigned to that specific voucher serial before the sale, not merely from whichever user is logged in during redemption.

Suggested voucher fields

Voucher ID • Batch • Serial Number • Status • Assigned Partner ID • Optional Store/Location ID • Assignment Date • Assignment History • Sale Transaction ID • Sale Date • Commission Amount Snapshot • Commission Status

5. Currency for the Commission Ledger

The commission ledger should be maintained in BRL. The Partner's commercial entitlement is a BRL amount (currently default R$60), even if customer funds pass through a USD-based Stripe/Wise structure.

- Store the Partner commission obligation in BRL.
- Wise may perform any required currency conversion during payout/funding.
- The Partner should receive the BRL amount defined for that sale.
- Exchange-rate movements must not retroactively change the commission amount already recorded.

6. Payout Cadence

Use an automatic daily consolidated payout per Partner. Do not make one bank transfer for every voucher.

Example

Partner João has 10 sold vouchers, but only 7 corresponding payments are settled/available today. If those 7 sales each carry R$60 commission, today's eligible consolidated payout is R$420. The other 3 remain pending until their funds become available.

- Only eligible commissions whose corresponding sale funds are settled/available enter the daily payout batch.
- One consolidated Partner payout may contain multiple voucher commissions.
- The system must preserve the list of every Voucher/Serial and commission amount included in each payout.
- Commission values may differ within the same payout because the amount is configurable and snapshotted per sale.
- Payout records should support reconciliation: Payout ID -> Partner -> included commission records -> total BRL -> Wise transfer/reference -> status.

7. Refund / Chargeback and Commission Offset

For normal customer refunds/chargebacks, the Partner should not be required to return commission money that has already been paid. Instead, unpaid commissions are cancelled; paid commissions become a negative Partner adjustment that is recovered from future commissions.

A. Commission not yet paid

If the refund/chargeback occurs before payout, cancel the related commission and record the Voucher/Serial, Sale ID, Partner, original commission amount, refund/chargeback date/reference and status.

B. Commission already paid

- Do not request an immediate bank transfer or repayment from the Partner.
- Create a negative commission balance equal to the exact commission originally paid for that voucher.
- Automatically inform the Partner.
- Offset that balance against future eligible commissions until it reaches zero.
- The recovery amount must use the historical commission actually paid for the old voucher, not the Partner's current commission rate.

C. Mandatory voucher-to-voucher traceability

Never show only a generic '-R$60 chargeback'. Every offset must create a permanent, auditable relationship between the old voucher that caused the debit and the new voucher commission(s) used to compensate it.

Chargeback Voucher -> **Chargeback Record** -> **Offset Allocation(s)** -> **New Voucher Commission(s)** -> **Final Settlement**

Example 1 - Full offset

Old Voucher #000125: commission R$60 already paid; chargeback occurs two months later -> negative balance R$60. New Voucher #001487 later generates R$60 commission. The system applies R$60 from #001487 to #000125. Remaining old balance = R$0; payable from #001487 = R$0.

Partner statement must explicitly show: Voucher #000125 (Chargeback -R$60) <-> compensated by Voucher #001487 (Commission +R$60).

Example 2 - Partial/multiple offsets

Old chargeback balance = R$70. New Voucher A commission = R$50 -> apply R$50, remaining R$20. New Voucher B commission = R$60 -> apply R$20, remaining old balance R$0, Partner receives R$40 from Voucher B.

The system must support one old chargeback being settled by multiple new commissions, and where necessary one new commission being allocated across more than one outstanding adjustment, while keeping every allocation explicit.

D. Partner statement and notification

- Original chargeback Voucher ID/Serial.
- Original Sale/Transaction ID and sale date.
- Commission originally paid.
- Refund/chargeback date and reference.
- New Voucher ID(s)/Serial(s) used for compensation.

- Commission generated by each new voucher.
- Exact amount applied from each new commission.
- Remaining negative balance.
- Final amount actually payable to the Partner.

Suggested notification: "Commission adjustment: the commission from Voucher #001487 was applied to offset the previously paid commission from Voucher #000125, which was subsequently charged back."

E. Exception - Partner irregularity

Suspected fraud, manipulation or irregular activity attributable to the Partner should be flagged as ADMIN REVIEW instead of being processed automatically as a normal customer chargeback.

Additional Admin / Audit Requirements

- Commission amount must be editable by Admin without code changes.
- Commission changes affect future eligible sales only; historical commission snapshots remain unchanged.
- Voucher assignment/reassignment history must never be deleted.
- Every commission must be reconstructible from Partner -> Voucher Serial -> Sale Transaction -> settlement status -> commission amount -> payout/offset record.
- Every payout must identify the individual voucher commissions included in it.
- Every chargeback deduction must identify both the old voucher and the new commission voucher(s) used in the offset.
- No unexplained debit, credit or commission adjustment should exist in the Partner ledger.
- Keep timestamps and status history for assignment, sale, settlement eligibility, commission creation, payout, chargeback and offset.

Recommended Status Model

Object	Suggested Statuses	Purpose
Voucher	UNASSIGNED / ASSIGNED / SOLD / REDEEMED / CANCELLED	Inventory and ownership lifecycle
Commission	PENDING_FUNDS / ELIGIBLE / INCLUDED_IN_PAYOUT / PAID / CANCELLED / CHARGEBACK_ADJUSTMENT / OFFSET_PARTIAL / OFFSET_SETTLED / ADMIN_REVIEW	Commission lifecycle
Payout	CREATED / SUBMITTED / PROCESSING / PAID / FAILED / REVIEW	Wise payout reconciliation

Final Implementation Summary

The system should behave as a controlled Partner commission ledger tied to physical voucher inventory. Vouchers are manufactured independently, assigned later to Partners by serial/batch, and generate a configurable BRL commission only on the original sale. Commission payout is funded by the actual settled proceeds of the sale. Stripe -> Wise remains on the existing automatic standard payout schedule. Eligible commissions are consolidated daily per Partner and paid through the Wise API to the Partner's Brazilian bank account. Refunds/chargebacks never create unexplained deductions: paid commission reversals are transparently offset against future voucher commissions with permanent old-voucher <-> new-voucher traceability.
